(54) Electronic Switch

(57) [Abstract]

[Problem To Be Solved] To provide [an electronic switch] capable of reliably notifying the operator that an operation has been performed by producing a click feel in response to the operation performed by the operator.

[Solution Means] In an electronic switch having a pushbutton part 2 that is pushed, [having] a plate spring 3 consisting of a flat plate part 3a that opposes the said pushbutton part and is depressed to depress a control 7a when the pushbutton part is pushed and a leg part 3b extended from approximately the center of the said flat plate part at a predetermined angle and activating the flat plate part in the rising direction when the flat plate part is depressed, and [having] a switch part 7 that outputs a signal when the control is depressed, a click feel producing part 3e is provided so that the flat plate part produces a click feel by projecting toward the side opposite to the pushbutton part and by being inverted from a projecting part to a recessed part by a predetermined pressure.
